Figure S2. Visualization of target genes and co-expressed lncRNAs. The top of the graph is the mRNA, the bottom of the graph is the lncRNA significantly co-expressed with the target gene, and the right of the graph is the mRNA in the gene set of this study, 333 in total.

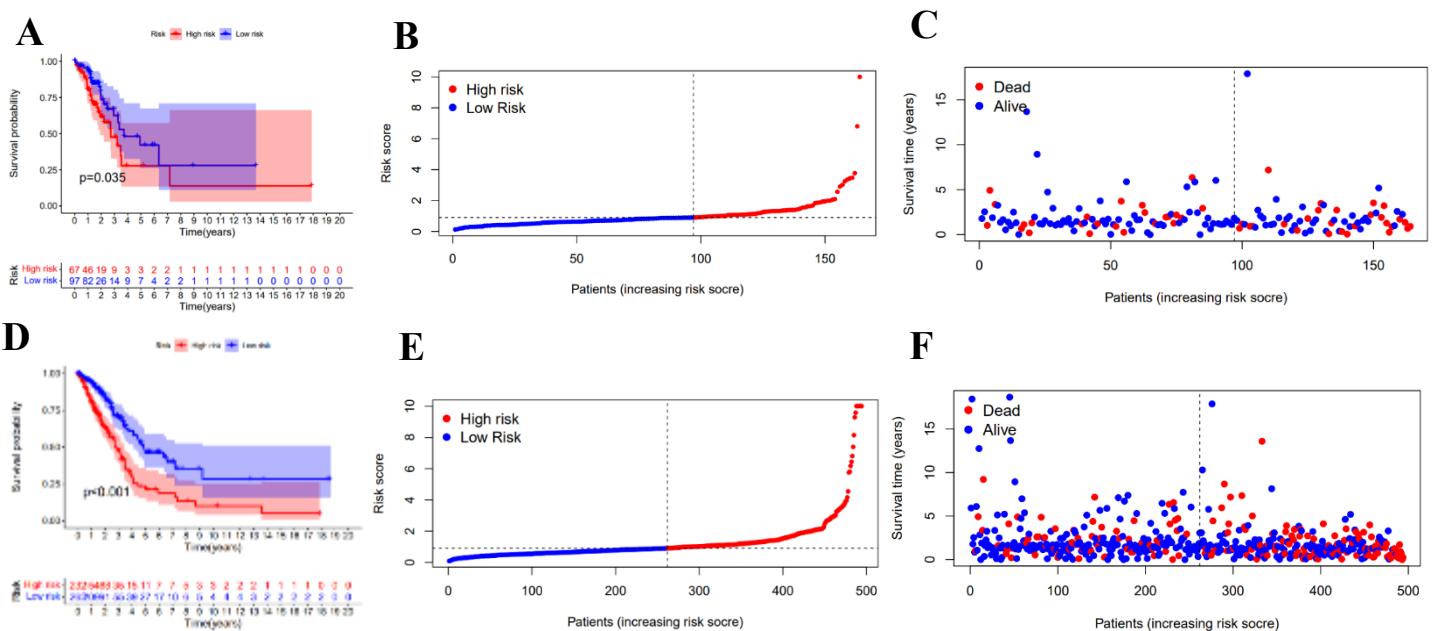

Figure S3. Validation of 7 lncRNA signatures in the test cohort and the entire cohort. (A), (B),

and (C) are the overall survival curve, risk score distribution, and survival status of the testing cohort. (D), (E), and (F) are the overall survival curve, risk score distribution, and survival status of the entire cohort.

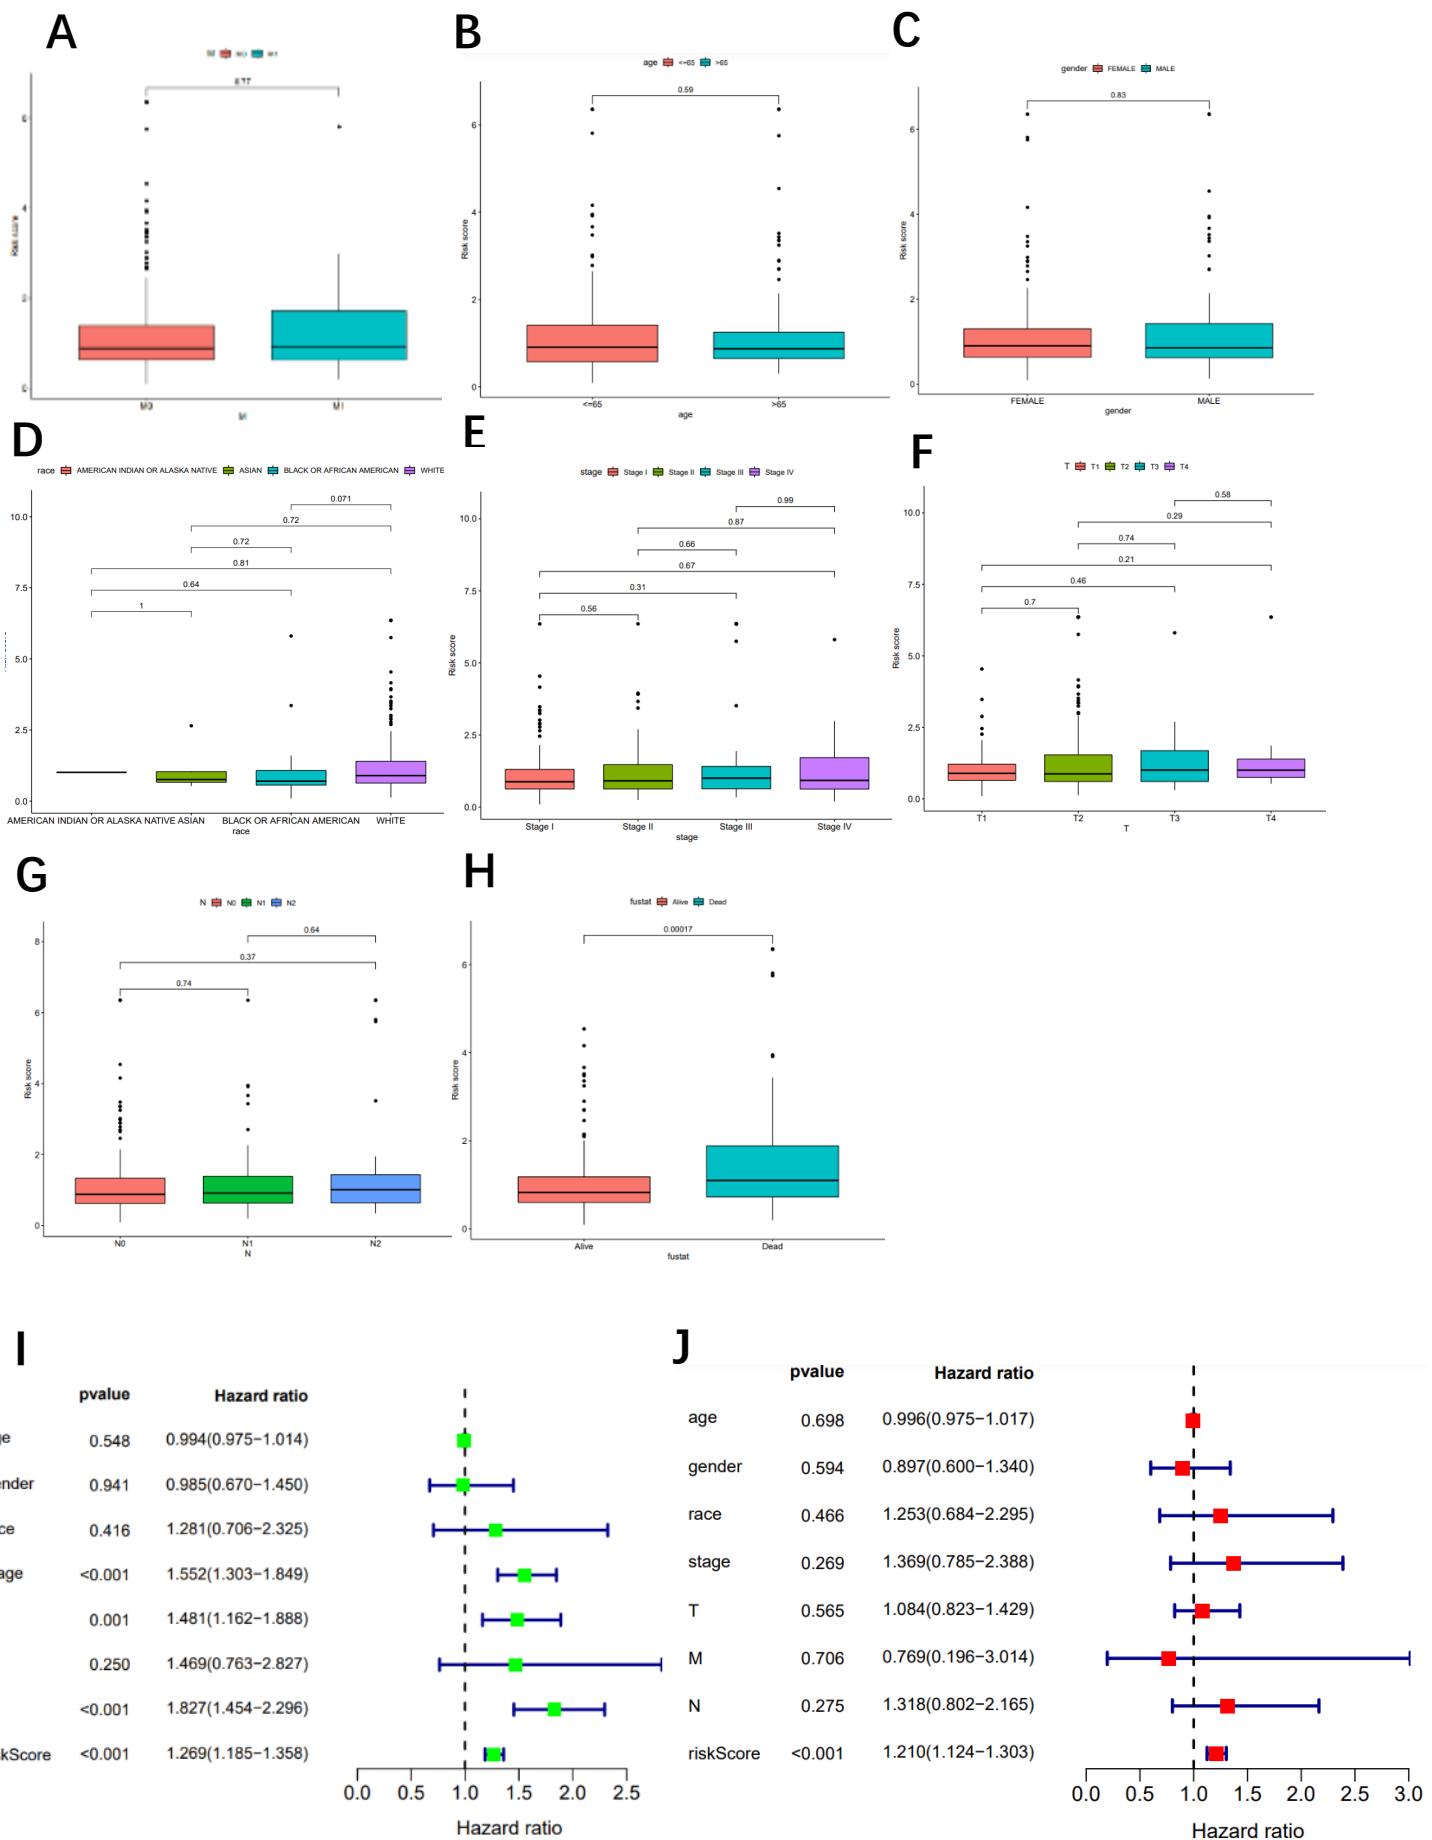

Figure S4. The images show the correlation between clinicopathological factors and risk scores.

These include M stage (A), age (B), gender (C), race (D), AJCC stage (E), stage T (F), stage N (G), and survival status (H). Univariate (A) and multivariate (B) Cox regression analysis of OS in the entire cohort.

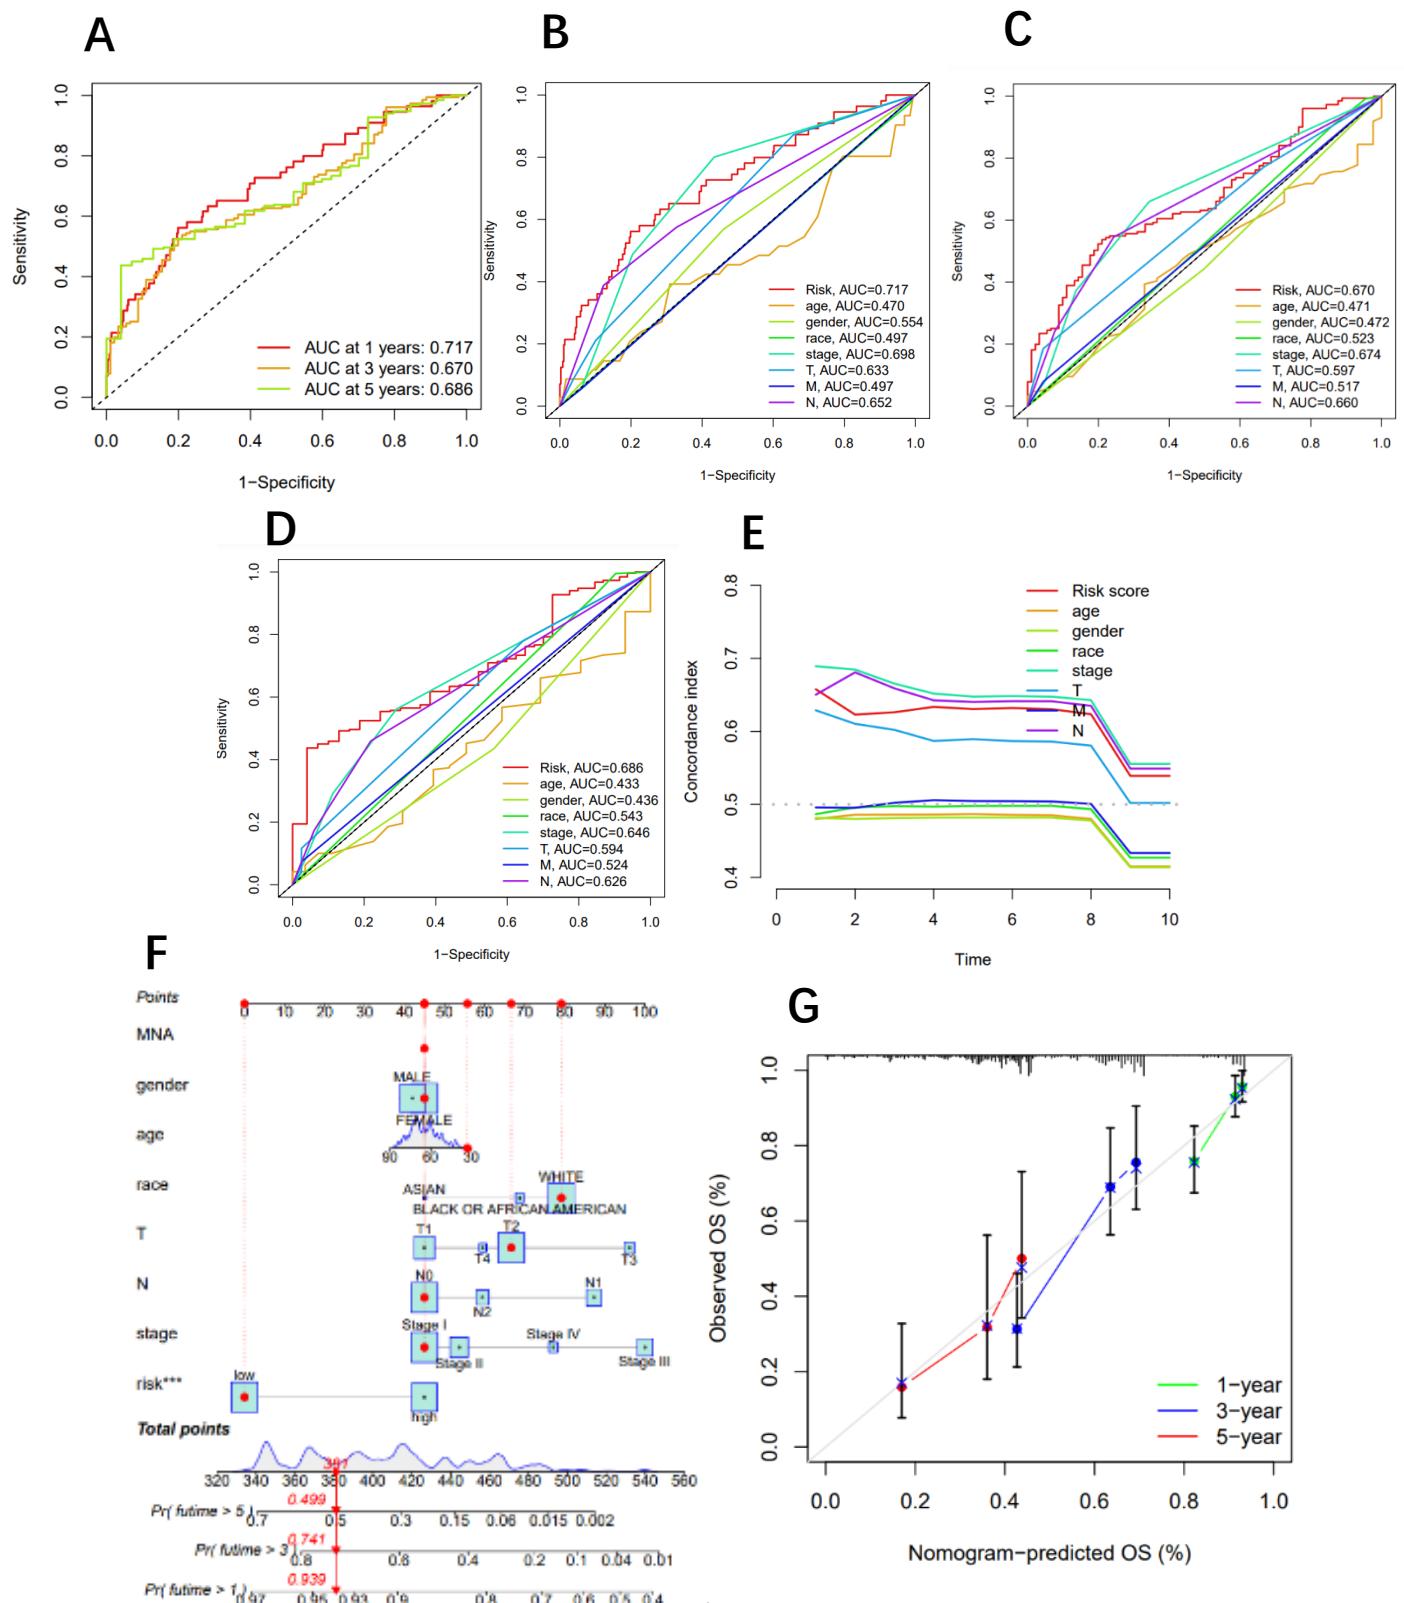

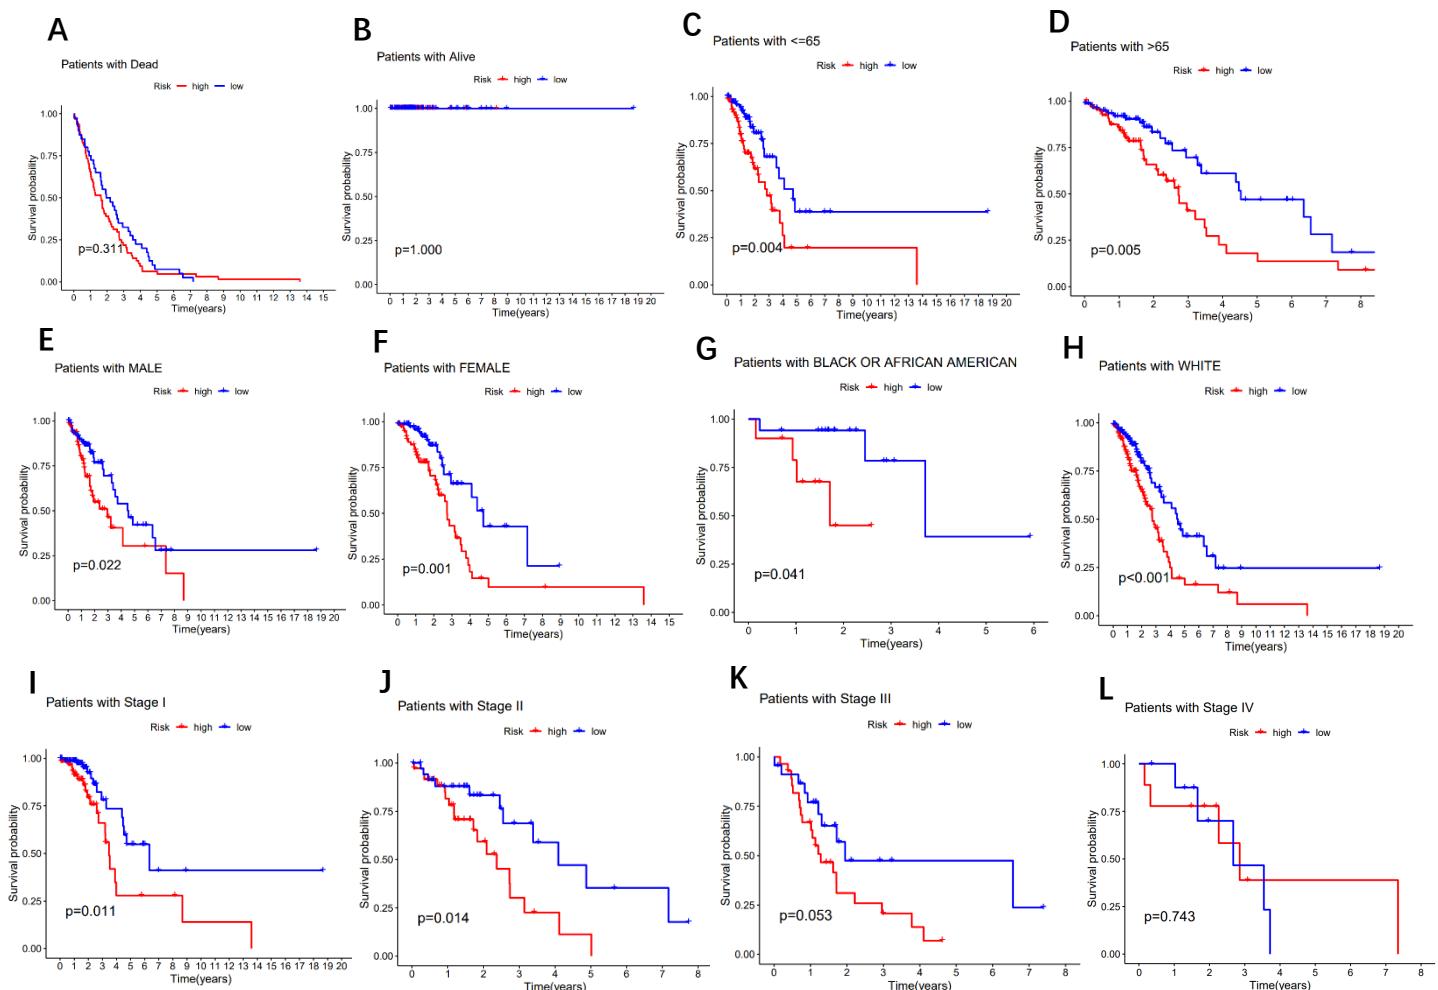

Figure S5. Prognostic modeling and evaluation of risk scores and clinicopathological factors constructed for patients with LUAD. The ROC curve AUCs for the prognostic model were 0.717, 0.670 and 0.686 at 1, 3 and 5 years, respectively (A). Clinicopathological indicators of 1-year (B), 3-year (C) and 5-year (D) survival probabilities. The C-index curves showed a C-index mostly between 0.6 and 0.7, with average accuracy (E). A nomogram was created to predict the 1-year, 3-year, and 5-year OS of LUAD patients. A vertical line was made from the value of each variable to the "point" axis to obtain the corresponding score, and the total score of all variables was calculated and projected onto the corresponding line at the bottom to obtain the 1-year, 3-year, and 5-year OS for LUAD patients (F). In the calibration curve of the prediction model, the gray line is the standard curve, and the green, blue and red lines represent the predicted values for 1, 3 and 5 years, respectively (G).

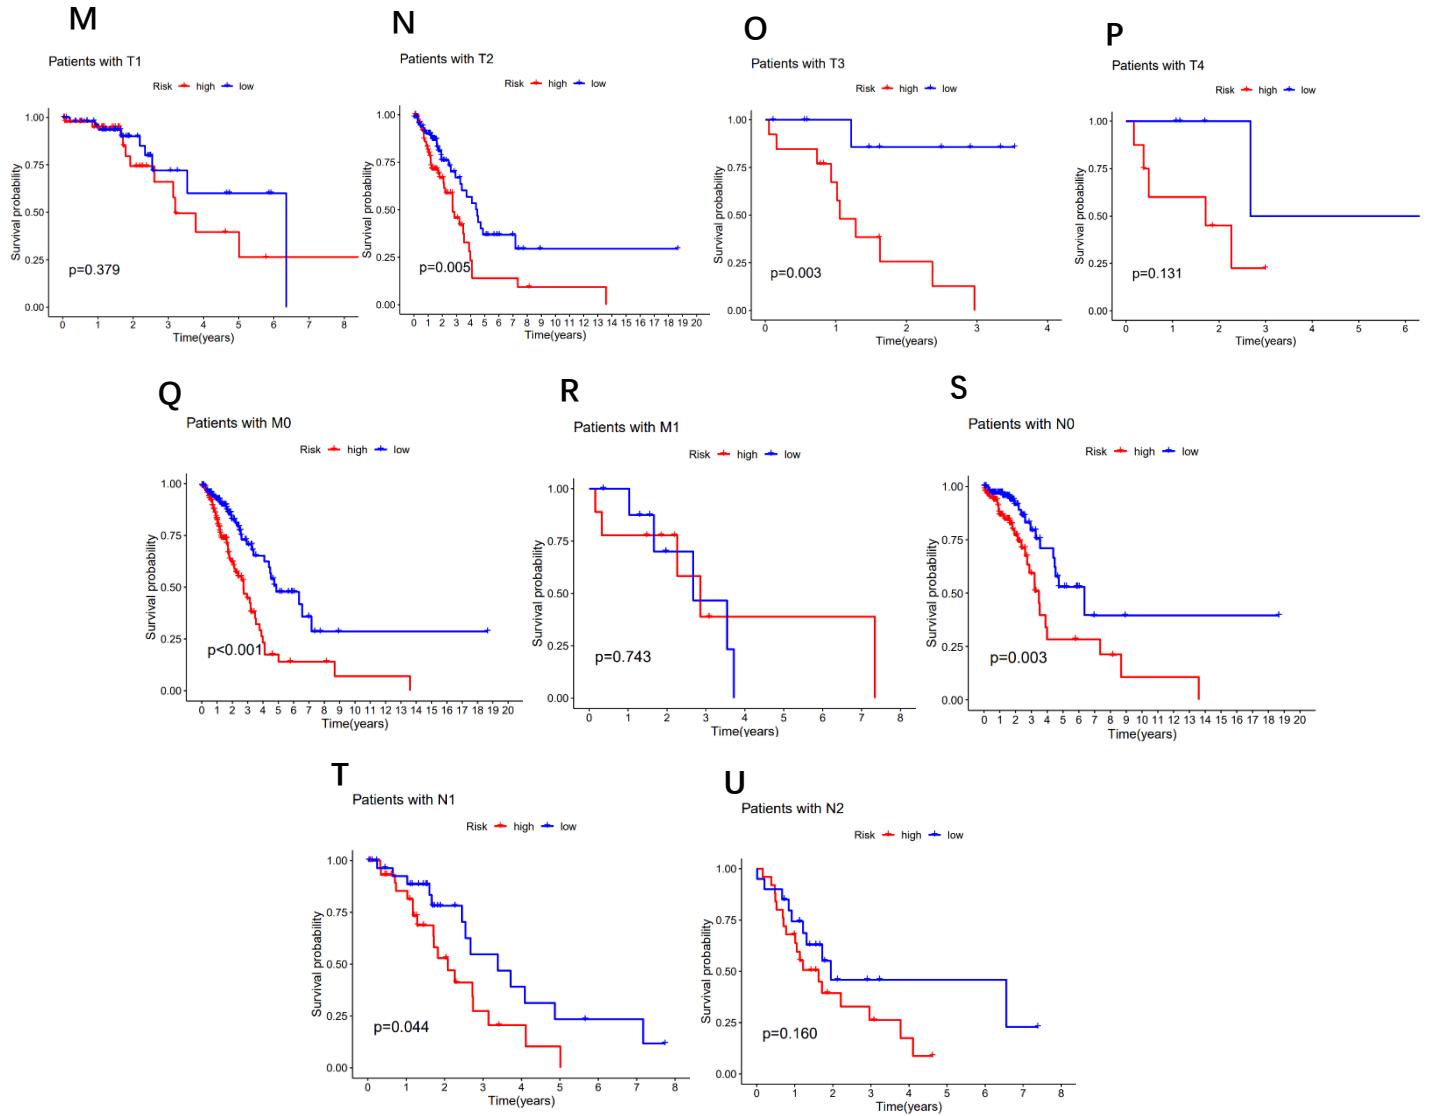

Figure S6. Overall survival in high- and low-risk subgroups based on clinicopathological factors

in LUAD patients. Kaplan-Meier survival curves showing OS rates for high and low-risk subgroups stratified by death (A), alive (B), age \leq 65 years (C), age $>$ 65 years (D), male (E), female (F), black or African American (G), and patients with white (H) AJCC Stages I-IV, T1-T4, M0-M1, and N0-N2 (I-U).

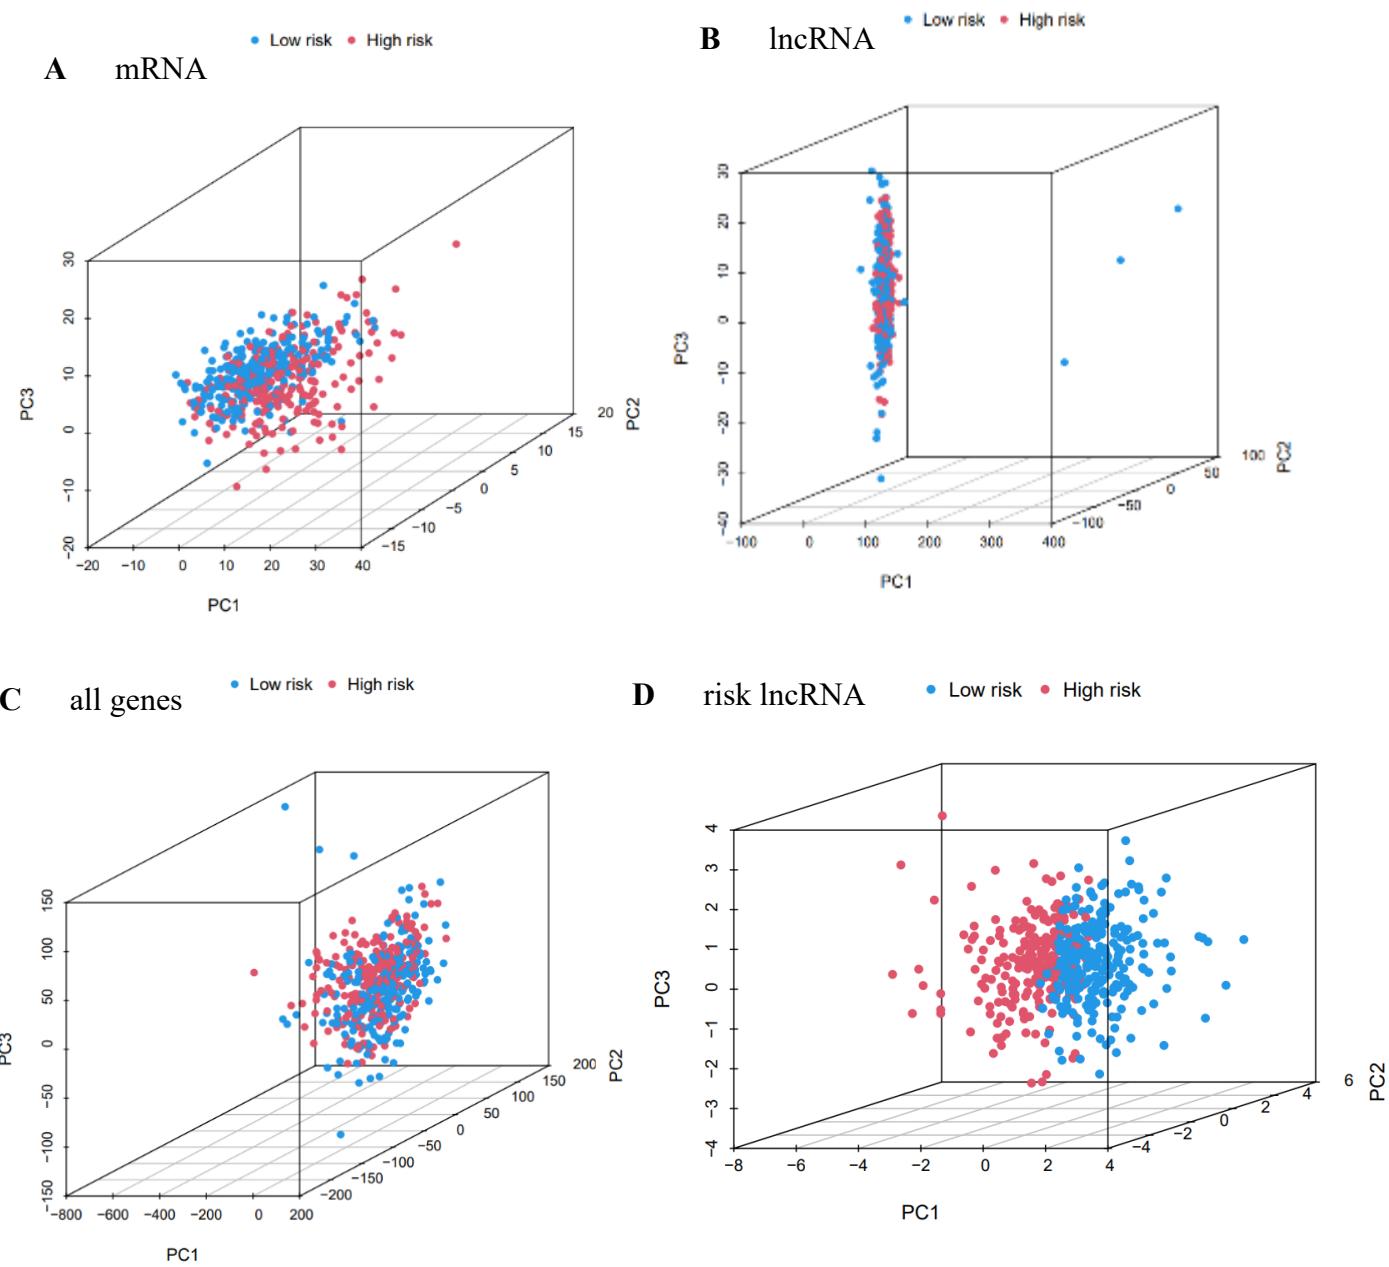

Figure S7. The results of principal component analysis. It revealed differences in gene expression between high-risk and low-risk subgroups in mRNA (A), lncRNA (B), all genes (C) and risk lncRNA (D).

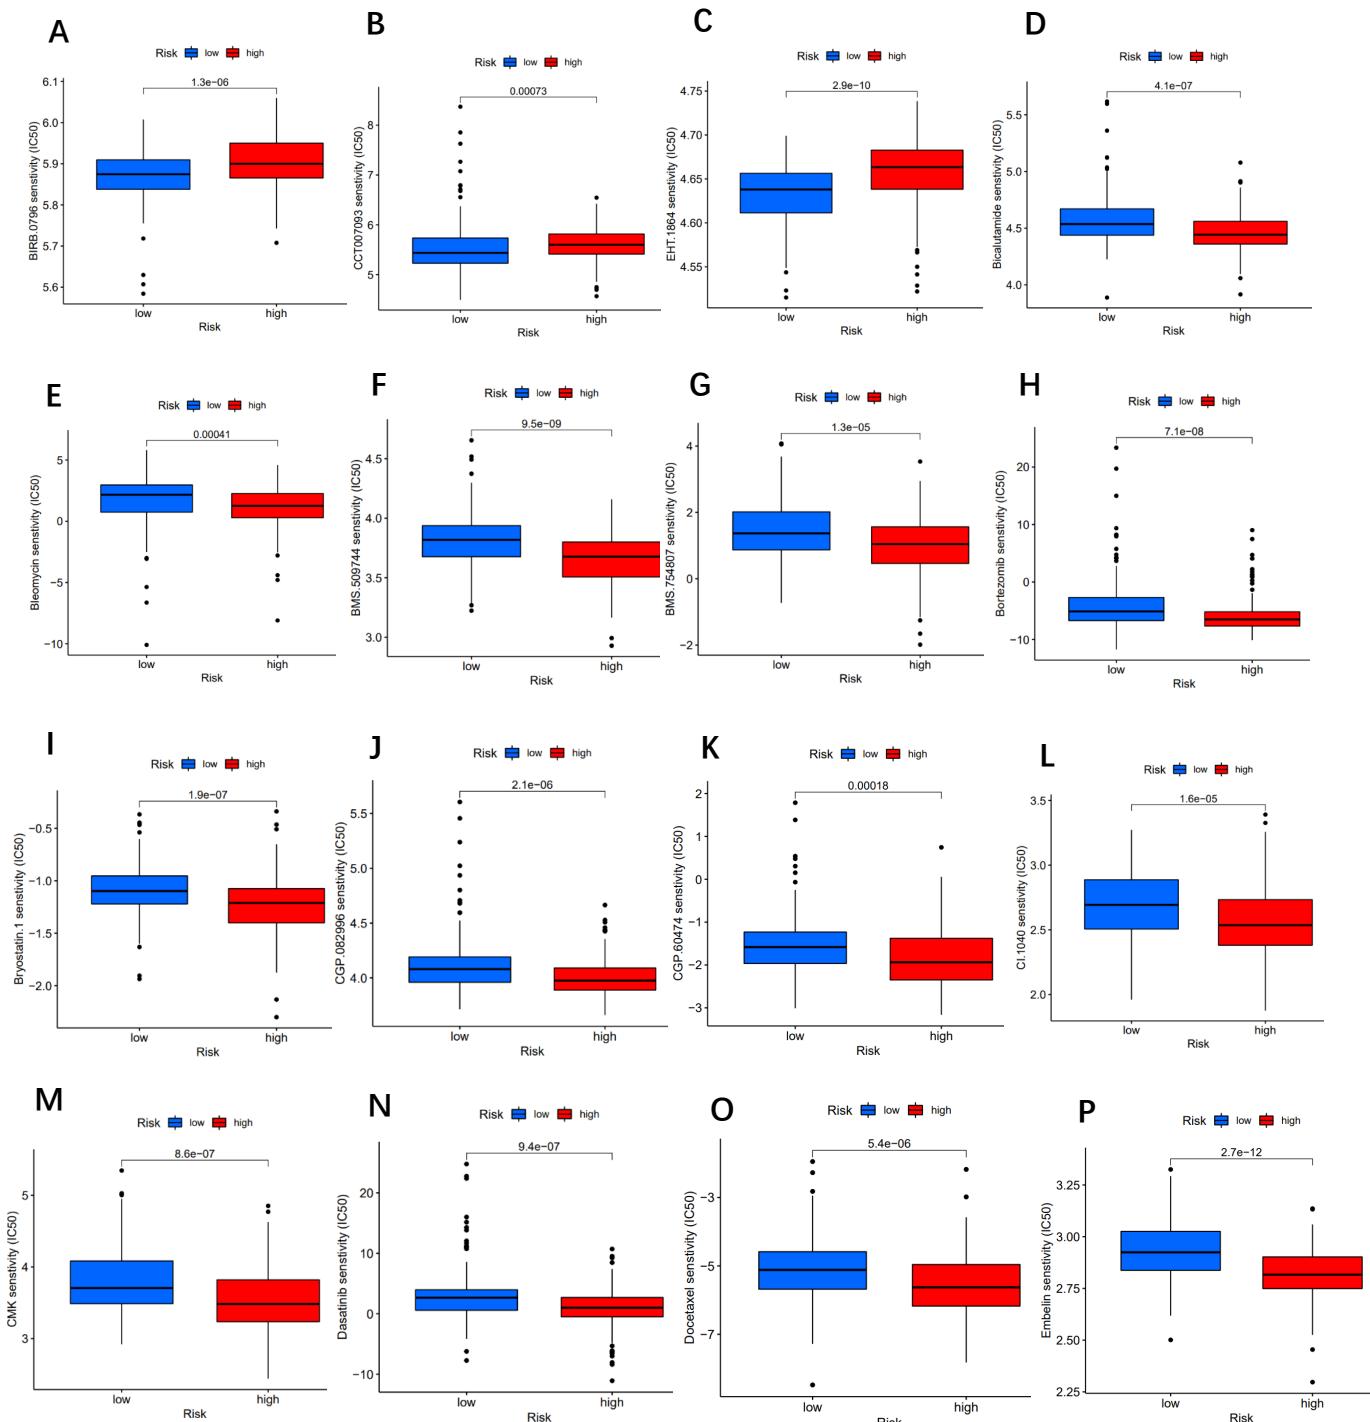

Figure S8. The figure below shows the top 16 drugs that might be used in LUAD patients.

Respectively, BIRB.0796 (A), CCT007093 (B), EHT.1864 (C), Bicalutamide (D), Bleomycin (E), BMS.509744 (F), BMS.754807 (G), Bortezomib (H), Bryostatin.1 (I), CGP.082996 (J), CGP.60474 (K), CI.1040 (L), CMK (M), Dasatinib (N), Docetaxel (O) and Embelin (P).

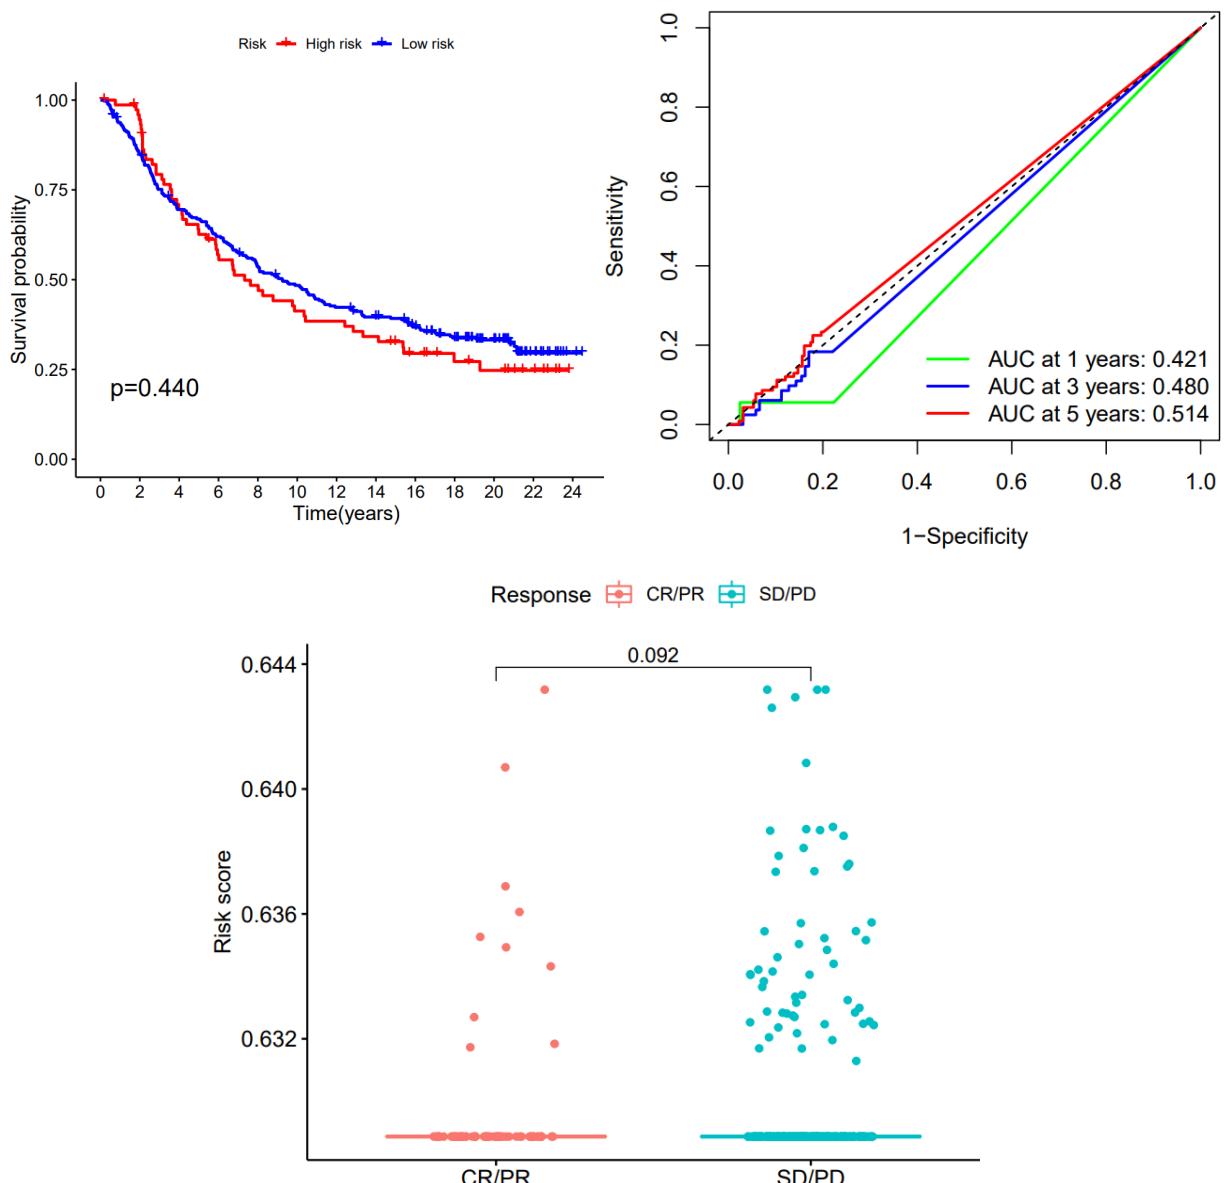

Figure S9. Validation with the IMvigor210 immunotherapy model. In the IMvigor210 model, there was no difference between high and low-risk subgroups (A). 1 and 3 years ROC curves were poorly predicted and 5 years ROC curves were well-predicted (B). No significant response to different immunotherapeutic agents (C).

Table S1. Results of 399 genes associated with the PI3K/Akt/mTOR pathway. The results show 399 genes after combining genes from four gene sets and excluding duplicates.

Table S3. Results of one-way Cox regression analysis for the entire cohort. The results of the one-way Cox regression analysis show the p-values, risk ratios (HR) and confidence intervals (CI) for the 339 significant genes in the entire cohort.

Table S4. Results of the univariate Cox regression analysis of the training cohort. Results of one-way Cox regression analysis showed p-values and risk ratios (HR) with confidence intervals (CI) for 415 differentially expressed genes in the training cohort.

Table S5. Results of multifactorial Cox regression analysis. The results showed that the p-values and risk ratios of the seven differentially expressed PAM-SRFLncSigs ended up with confidence intervals.
